Question 22.	Find the value of a, b, c, and d from the equations:		
	$\begin{bmatrix} a-b & 2a+c \\ 2a-b & 2a+c \end{bmatrix} = \begin{bmatrix} -1 & 5 \\ 0 & 12 \end{bmatrix}$		
Solution:	Equate the corresponding elements of the matrices:		
	$a - b = -1 \dots (1)$ $2a + c = 5 \dots (2)$	1	
	2a - b = 0(3) $3c + d = 13$ (4)	$\frac{1}{2}$	
	Equation (1) -Equation (3)		
	$-a = -1 \Longrightarrow a = 1$	$\frac{1}{2}$	
	Equation (1) $\Rightarrow$ 1 - b = - 1 $\Rightarrow$ b = 2		
	Equation (2) $\Rightarrow 2(1) + c = 5 \Rightarrow c = 3$

	Therefore, $a = 1$ , $b = 2$ , $c = 3$ and $d = 4$	1	
Question 23.	Find the value of k so that the function is continuous at the indicated point $f(x) = \begin{cases} kx + 1, & x \le 5 \\ 3x - 5, & x > 5 \end{cases}$ at x = 5.		
Solution:	(3x - 3, x - 3)		
	Given function is $f(x) = \begin{cases} xx + 1, & x \le 3\\ 3x - 5, & x > 5 \end{cases}$		
	When $x < 5$ , $f(x) = kx + 1$ : A polynomial is continuous at each point $x < 5$		
	When $x > 5$ , $f(x) = 3x-5$ : A polynomial is continuous at each point $x > 5$	$\frac{1}{2}$	
	Now $f(5) = 5k + 1$	2	
	$\lim_{x \to 5} f(x) = \lim_{h \to 0} f(5+h) = 3(5+h) - 5 = 15 + 3h - 5$

	$= \lim_{h \to 0} (5k - hk + 1) = 5k + 1 \qquad \dots (2)$	1	
	Since function is continuous, therefore, both the equations are equal, Equate both the equations and find the value of k,		
	10 = 5k + 1 5k = 9 k = 9/5	$\frac{1}{2}$	
Question 24.	Verify that the function $y = x \sin 3x$ , is a solution of the differential equation $\frac{d^2y}{dx^2} + 9y - 6\cos 3x = 0$		
Solution:	Given: $y = x \sin 3x$		
	Diff. w.r.t. 'x', and we get		

	$\frac{dy}{dx} = \sin 3x + 3x \cos 3x \qquad \dots (1)$	$\frac{1}{2}$
	Again differentiate (1) w.r.t. 'x', we get	
	$\frac{d^2y}{dx^2} = 3\cos 3x + 3\left[\cos 3x + x\ (-\sin 3x).\ 3\right]$	
	On simplifying the above equation, we get	
	$\frac{d^2 y}{dx^2} = 6\cos 3x - 9x\sin 3x \qquad(2)$	$\frac{1}{2}$
	Now, substitute (1) and (2) in the given differential equation, and we get the following:	
	$L.H.S = \frac{d^2y}{dx^2} + 9y - 6\cos 3x$	
	$= (6\cos 3x - 9x\sin 3x) + 9(x\sin 3x) - 6\cos 3x$	
	$= 6\cos 3x - 9x\sin 3x + 9x\sin 3x - 6\cos 3x$	1
	= 0 = R.H.S	
	As L.H.S = R.H.S, the given function is the solution of the corresponding differential equation.	
OR Ouestion 24	Find the general solution of the differential equation $\frac{dy}{dx} = \frac{1+y^2}{1+y^2}$	
Solution:	Since $1 + y^2 \neq 0$ , therefore separating the variables, the given differential equation	
	$\frac{dy}{1+y^2} = \frac{dy}{1+x^2} \qquad \dots \dots (1)$	$\frac{1}{2}$
	Integrating both sides of equation (1), we get	
	$\int \frac{\mathrm{d}y}{1+y^2} = \int \frac{\mathrm{d}y}{1+x^2}$	
	$\tan^{-1}y = \tan^{-1}x + C$	$1\frac{1}{2}$
	which is the general solution of equation (1)	
Question 25.	Two balls are drawn at random with replacement from a box containing 10 black and 8 red balls. Find the probability that both balls are red.	
Solution:	Total number of balls = $10$ black balls + 8 red balls = $18$ balls	
	Probability of getting a red ball in the first draw $=\frac{8}{18}=\frac{4}{9}$	$\frac{1}{2}$
	As the ball is replaced after the first throw,	
	:. Probability of getting a red ball in the second draw $=\frac{8}{18}=\frac{4}{9}$ Since the two balls are drawn with replacement, the two draws are independent.	$\frac{1}{2}$
	P(both balls are red) = P(first ball is red) x P(second ball is red)	
	Now, the probability of getting both balls red = $\frac{4}{9} \times \frac{4}{9} = \frac{16}{81}$	1

Question 26.	Let $A = \mathbf{R} - \{3\}$ and $\mathbf{B} = \mathbf{R} - \{1\}$ . Consider the function $f : A \rightarrow B$ defined by	
	$f(x) = \left(\frac{x-2}{x-3}\right)$ . Is f one one and onto? Justify your answer.	
Solution:	$A = R - \{3\}$ and $B = R - \{1\}$	
	f: A $\rightarrow$ B defined by f(x) = (x - 2) / (x - 3) Let (x, y) $\subset$ A then	
	$f(x) = \frac{(x-2)}{x}$ and $f(y) = \frac{(y-2)}{x}$	
	(x-3) and $(y) = (y-3)$	
	For $f(x) = f(y)$	1
	$\frac{(x-2)}{(x-2)} = \frac{(y-2)}{(x-2)}$	2
	$ (x-3)  (y-3) \\ (x-2)(y-3) = (y-2)(x-3) $	
	x y - 3x - 2y + 6 = xy - 3y - 2x + 6	
	-3x - 2y = -3y - 2x -3x + 2x3y + 2y	
	$-\mathbf{x} = -\mathbf{y}$	
	x = y Therefore, f is a one one function	1
	Therefore, T is a one-one function.	-
	Again, $y = f(x) = \frac{(x-2)}{(x-2)}$	
	$\mathbf{v} = \frac{(\mathbf{x} - \mathbf{z})}{\mathbf{z}}$	
	y'(x-3) = x - 2	1
	$\begin{array}{l} y(x) = y(x) \\ xy - 3y = x - 2 \end{array}$	2
	x(y-1) = 3y - 2	
	or $x = \frac{(3y-2)}{(y-1)}$	
	Now, $f(\frac{3y-2}{y-1}) = \frac{3y-2}{y-2} = 2$	
	$\Rightarrow \frac{y-1-2}{3y-2-3} = y$	
	$\int_{y-1}^{y-1} \int_{y-1}^{y-1} f(x) = y$	
	Therefore, f is onto function.	1

	Subtract equation (4) from (3)	
	$-5X = \begin{bmatrix} 4 & 6 \\ 8 & 0 \end{bmatrix} - \begin{bmatrix} 6 & -6 \\ -3 & 15 \end{bmatrix} = \begin{bmatrix} -2 & 12 \\ 11 & -15 \end{bmatrix}$

Question 28.	Find $\frac{dy}{dx}$ of the function $y^x = x^y$	
Solution:	Given: $y^x = x^y$	
	$x^{y} = y^{x}$	
	$log(x^y) = log(y^x)$	
	$y.\log x = x.\log y$	1
	$\frac{d}{dx}(y.\log x) = \frac{d}{dx}(x.\log y)$	
	y. $\frac{1}{x}$ + log x. $\frac{dy}{dx}$ = x. $\frac{1}{y}$ . $\frac{dy}{dx}$ + log y.1	

	$(\log x - \frac{x}{y}) \cdot \frac{dy}{dx} = \log y - \frac{x}{y}$	$1\frac{1}{2}$
	$\left(\frac{(y\log(x) - x)}{y}\right)\frac{dy}{dx} = \frac{(x\log(y) - y)}{x}$	
	$\frac{dy}{dx} = \frac{y(x \log(y) - y)}{x(y \log(x) - x)}$	$\frac{1}{2}$
Question 29.	Find the intervals in which the function $f$ is given by	
Solution:	$\begin{array}{l} f(x) = 2x^{2} - 3x^{2} - 36x + 7 \text{ is strictly increasing or strictly decreasing.} \\ \hline \text{Given function: } f(x) = 2x^{3} - 3x^{2} - 36x + 7 \\ \hline \text{Diff. w.r.t. 'x'} \\ f'(x) = 6x^{2} - 6x + 36 = 6(x^{2} - x - 6) \end{array}$	
	$f'(x) = 6(x - 3)(x + 2) \qquad ,(1)$ Now for increasing or decreasing, $f'(x) = 0$ 6(x - 3)(x + 2) = 0 $x - 3 = 0 \qquad \text{or} \qquad x + 2 = 0$	
	x = 3 or x = -2 Therefore, we have sub-intervals are $(-\infty, -2)$ , $(-2, 3)$ and $(3, \infty)$	1
	For interval $(-\infty, -2)$ , picking x = -3, from equation (1), f' (x) = $(+ve)(-ve)(-ve) = (+ve) > 0$ Therefore, f is strictly increasing in $(-\infty, -2)$	$\frac{1}{2}$
	For interval (-2, 3), picking $x = 0$ , from equation (1), f'(x) = (+ve)(-ve) (+ve) = (-ve) < 0 Therefore, f is strictly decreasing in (-2, 3).	$\frac{1}{2}$
	For interval $(3, \infty)$ , picking $x = 4$ , from equation (1), f' $(x) = (+ve)(+ve)(+ve) = (+ve) > 0$ Therefore, is strictly decreasing in $(3, \infty)$ .	$\frac{1}{2}$
	So, f is strictly increasing in $(-\infty, -2)$ and $(3, \infty)$ . f is strictly decreasing in $(-2, 3)$ .	$\frac{1}{2}$
Question 30.	Integrate: $\int x^2 \log x  dx$	
Solution:	It is given that $I = \int x^2 .\log x  dx$	
	Here by taking x as first function and x <sup>2</sup> as second function. Now integrating by	
	parts we get $I = \log x \int x^2 dx - \int \{ \frac{d}{dx} (\log x) . \int x^2 dx \} . dx$	$\frac{1}{2}$
	So we get $3 + 1 + x^3$	
	$= \log(x) \cdot \frac{x^3}{3} - \int \frac{1}{x} \cdot \frac{x^3}{3} dx$	1
	By multiplying the terms	
	$=\frac{x^3 \log x}{3} - \int \frac{x^2}{3} dx$	
	It can be written as	
	$= \frac{x^3 . \log x}{3} - \frac{x^3}{9} + C$	$1\frac{1}{2}$
OR Question 30	Evaluate: $\int_{-5}^{5}  \mathbf{x} + 2  d\mathbf{x}$	

Solution:	$I = \int_{-1}^{5}  x + 2  dx$	
	We know $ x+2  = \begin{cases} -(x+2), & x \le -2\\ (x+2), & x \ge -2 \end{cases}$	$\frac{1}{2}$
	$I = \int_{-5}^{-2}  x + 2  dx + \int_{-2}^{5}  x + 2  dx$	
	$I = \int_{-5}^{-2} -(x+2)  dx + \int_{-2}^{5} (x+2)  dx$	
	$\mathbf{I} = \left  \frac{-(x+2)^2}{2} \right _{-5}^{-2} + \left  \frac{(x+2)^2}{2} \right _{-2}^{5}$	$1\frac{1}{2}$
	$\mathbf{I} = \left(\frac{-(0)^2}{2} - \frac{-(-3)^2}{2}\right) + \left(\frac{(7)^2}{2} - \frac{(0)^2}{2}\right)$	
	$I = \frac{9}{2} + \frac{49}{2}$

Question 31.	The two adjacent sides of a parallelogram are $2\hat{i} - 4\hat{j} + 5k$ and $\hat{i} - 2\hat{j} - 3k$ . Find the unit vector parallel to its diagonal	
Solution:	Adjacent sides of a parallelogram are given as:	
	$\vec{a} = 2\hat{\imath} - 4\hat{\jmath} + 5\hat{k}$ and $\vec{b} = \hat{\imath} - 2\hat{\jmath} - 3\hat{k}$	
	We know that, the diagonal of a parallelogram is given by $\vec{a} + \vec{b}$	
	$\vec{a} + \vec{b} = (2+1)\hat{\imath} + (-4-2)\hat{\jmath} + (5-3)\hat{k} = 3\hat{\imath} - 6\hat{\jmath} + 2\hat{k}$	1
	$ \vec{a} + \vec{b}  = \sqrt{(3)^2 + (-6)^2 + (2)^2}$	1
	Hence, the unit vector parallel to the diagonal is	
	$\frac{\vec{a} + \vec{b}}{ \vec{a} + \vec{b} } = \frac{3\hat{\imath} - 6\hat{\jmath} + 2k}{\sqrt{(3)^2 + (-6)^2 + (2)^2}}$

	$=\frac{3}{7}\hat{\iota} - \frac{6}{7}\hat{j} + \frac{2}{7}\hat{k}$	1

Solution:

Solution:	The vector equation of a line passing through a point with position vector $\vec{a}$ and parallel to $\vec{b}$ is $\vec{r} = \vec{a} + \lambda \vec{b}$ . It is given that, the line passes through (1, 2, -4)	
	So, $\vec{a} = 1\hat{\imath} + 2\hat{\jmath} - 4\hat{k}$	
	Given lines are $\frac{x-8}{3} = \frac{y+19}{-16} = \frac{z-10}{7}$ and $\frac{x-15}{3} = \frac{y-29}{8} = \frac{z-5}{-5}$	1
	It is also given that, line is perpendicular to both given lines. So we can say that the line is perpendicular to both parallel vectors of two given lines.	
	We know that, $\vec{a} \times \vec{b}$ is perpendicular to both $\vec{a} & \vec{b}$ , so let $\vec{b}$ is cross product of parallel vectors of both lines i.e. $\vec{b} = \vec{b_1} \times \vec{b_2}$ where $\vec{b_1} = 3\hat{i} - 16\hat{j} + 7\hat{k}$ and $\vec{b_2} = 3\hat{i} - 8\hat{j} - 5\hat{k}$	2

Question 38.	Ratna has two boxes I and II. Box I contains 3 red and 6 black balls. Box II	
	contains 5 red and 5 black balls. Her friend Shivani selects one of the two boxes	
	randomly and draws a ball out of it. The ball drawn by Shivani is found to be red. Let $E_1$ , $E_2$ and A denote the following events:	
	$E_1$ : Box I is selected by Shiavni.	
	$E_2$ : Box II is selected by Shiavni.	
	A : Red ball is drawn by Shivani. (a) Find $P(F_{a})$ and $P(F_{a})$ (1)	
	(a) Find $P(E_1)$ and $P(E_2)$ (1) (b) Find $P(A E_1)$ and $P(A E_2)$ (1)	
	(c) Find $P(E_2   A)$ (2)	
Solution		
Solution.	(a) $P(E_1)$ : Probability of selecting Box I by Shiavni = $\frac{1}{2}$	1
	$P(E_1)$ : Probability of selecting Box I by Shiavni = $\frac{1}{2}$	1
	(b) $P(A E_1) = Probability of selecting a red ball when box I has been already$	
	selected = $\frac{3}{2}$	
	$P(A E_2) = Probability of selecting a red ball when box II has been already$	
	selected = $\frac{5}{10}$	1
	(c) $P(E_2 \mid A) - Probability$ that a red ball is drawn from the box II	
	$(C) \Gamma(L_2   R) = \Gamma(C) a C (C) C (C$	
	By Bayes' Theorem	
	$P(E_2).P(A E_2)$	
	$P(E_2   A) = \frac{P(E_1) \cdot P(A E_1) + P(E_2) \cdot P(A E_2)}{P(E_1) \cdot P(A E_1) + P(E_2) \cdot P(A E_2)}$	

$$P(E_2 | A) = \frac{\frac{1}{2} \cdot \frac{5}{10}}{\frac{1}{2} \cdot \frac{3}{9} + \frac{1}{2} \cdot \frac{5}{10}}$$

$$P(E_2 | A) = \frac{\frac{1}{4}}{\frac{1}{6} + \frac{1}{4}}$$

$$P(E_2 | A) = \frac{\frac{1}{4}}{\frac{4+6}{24}} = \frac{1}{4} \times \frac{24}{10} = \frac{3}{5}$$
